An anime-inspired streetwear storefront for ZENJI, built as a frontend with **Next.js 15 (App Router)**, **TypeScript strict** and **Tailwind v4**.

Ten pieces, limited stock, no restocks. The full shop flow works end to end — browse the drop, open a product, pick a size, add to cart, check out, and get a confirmed order with an order number.

- Drop listing with filter and sort held in the URL and applied on the server
- Product pages with real per-size stock, sold-out states and a five-shot gallery
- Cart drawer, validated checkout and an order confirmation
- Lookbook, our story, FAQ with a size guide, 404 and client-side search
- Per-page SEO metadata, sitemap, robots and Product JSON-LD
- Responsive from 320px to 2560px; zero layout shift; keyboard accessible

No backend, database, authentication or payment integration, as briefed.

Products are typed data, the cart lives in localStorage, and no card details are ever requested. Design reasoning and quality notes are in the repository README and DESIGN.md.
